Hydrographic Data from the Weddell Gyre

LDGO 89-1
Lamont-Doherty Geological Observatory
of Columbia University
Palisades, New York

1989

Cover Illustration:

The Weddell Basin; coast - thick line, 2500m isobath - dotted line and 4000m isobath - thin solid line. Coastline data is an L-DGO data set. Bathymetry data is DBDB5.

Hydrographic Data from the Weddell Gyre

This report is a compilation of data selected from the archives of the Arctic and Antarctic Research Institute (AARI), Leningrad, USSR and the Physical Oceanography Section (POS) at the Lamont-Doherty Geological Observatory. The bulk of the data is drawn from the AARI archive; it includes the historical data set plus recent AARI cruise data (see index of cruises). The POS data set includes; the US-USSR Weddell Polynya Experiment of 1981 (Wepolex), (Huber *et al.*, 1983), the Ajax Expedition, leg II (Ajax), (SIO, 1985), and the Winter Weddell Sea Expedition 86 (ANT V/2). Stations duplicated within the POS archive are not reported.

The AARI data consists of 140 cruises, numbered sequentially by the AARI, located within the area bounded by 50°S to the Antarctic continent and 30°E to 70°W. There are 6,592 stations dating from 1912 to 1988. Thirteen cruises are of unknown origin and contain some stations with no time information. There is no data for cruise 57. If there were no station numbers for a cruise, they were numbered sequentially from one in order of extraction. These cruises will not be ordered by date as the data file was sorted geographically.

There are five other cruises from the AARI which did not have cruise numbers and which we have named using the ship name and the year at the start of the cruise; Acad. Krilov - Krilov84, Prof. Vieze - Vieze84, Vieze86 and Vieze88 and Prof. Zubov - Zubov87. Eighty stations from this group fall outside the area denoted above, mostly to the west, and are included in the listings.

The AARI data was transcribed from tape, except for Krilov84, Vieze84, Vieze86 and Zubov87 which were entered by hand (Vieze88 was on the original data tape). Pressure was computed from depth and latitude using the inverse of the algorithm by Saunders (1981).

The POS data set contains 252 stations from Wepolex, ANT V/2 and Ajax that are within the area of interest, and only they are included. These data do not contain depth.

The data are presented at levels established at the AARI and are based on depth. Due to the conversion from depth to pressure, they will not match data presented by pressure. The AARI data entered by hand were not at the same levels as the data from tape, levels were chosen as close as possible to match the other data.

Due to the magnitude of the report the pages are not numbered. A short description of the contents follows:

- Index of cruises - AARI cruise number, ship name and country of ship origin, NODC ship and country code and number of stations. Cruises with no AARI number are listed under cruise name.

- Sections - eight potential temperature sections with a station map of all data from the 1980's that extend to 500m with lines denoting section locations.

- Station maps - all cruises for the area 50°S to 80°S and 30°E to 70°W. The

station maps contain all the information as in the cruise index and the years the data spans.

Data listings - pressure, temperature, salinity and depth (where present) for all stations. Each station is identified by the cruise at the head of the page. Individual stations give the station number, date as year, month and day, GMT and latitude and longitude as degrees and decimal minutes.

Appendix - explanation of salinity errors.

The cooperation of the Arctic and Antarctic Research Institute is greatly appreciated. This work was conducted during a visit by Dr. Bagriantsev to the Lamont-Doherty Geological Observatory. Funding was provided by NFS grant DPP-85-02386.

Note:

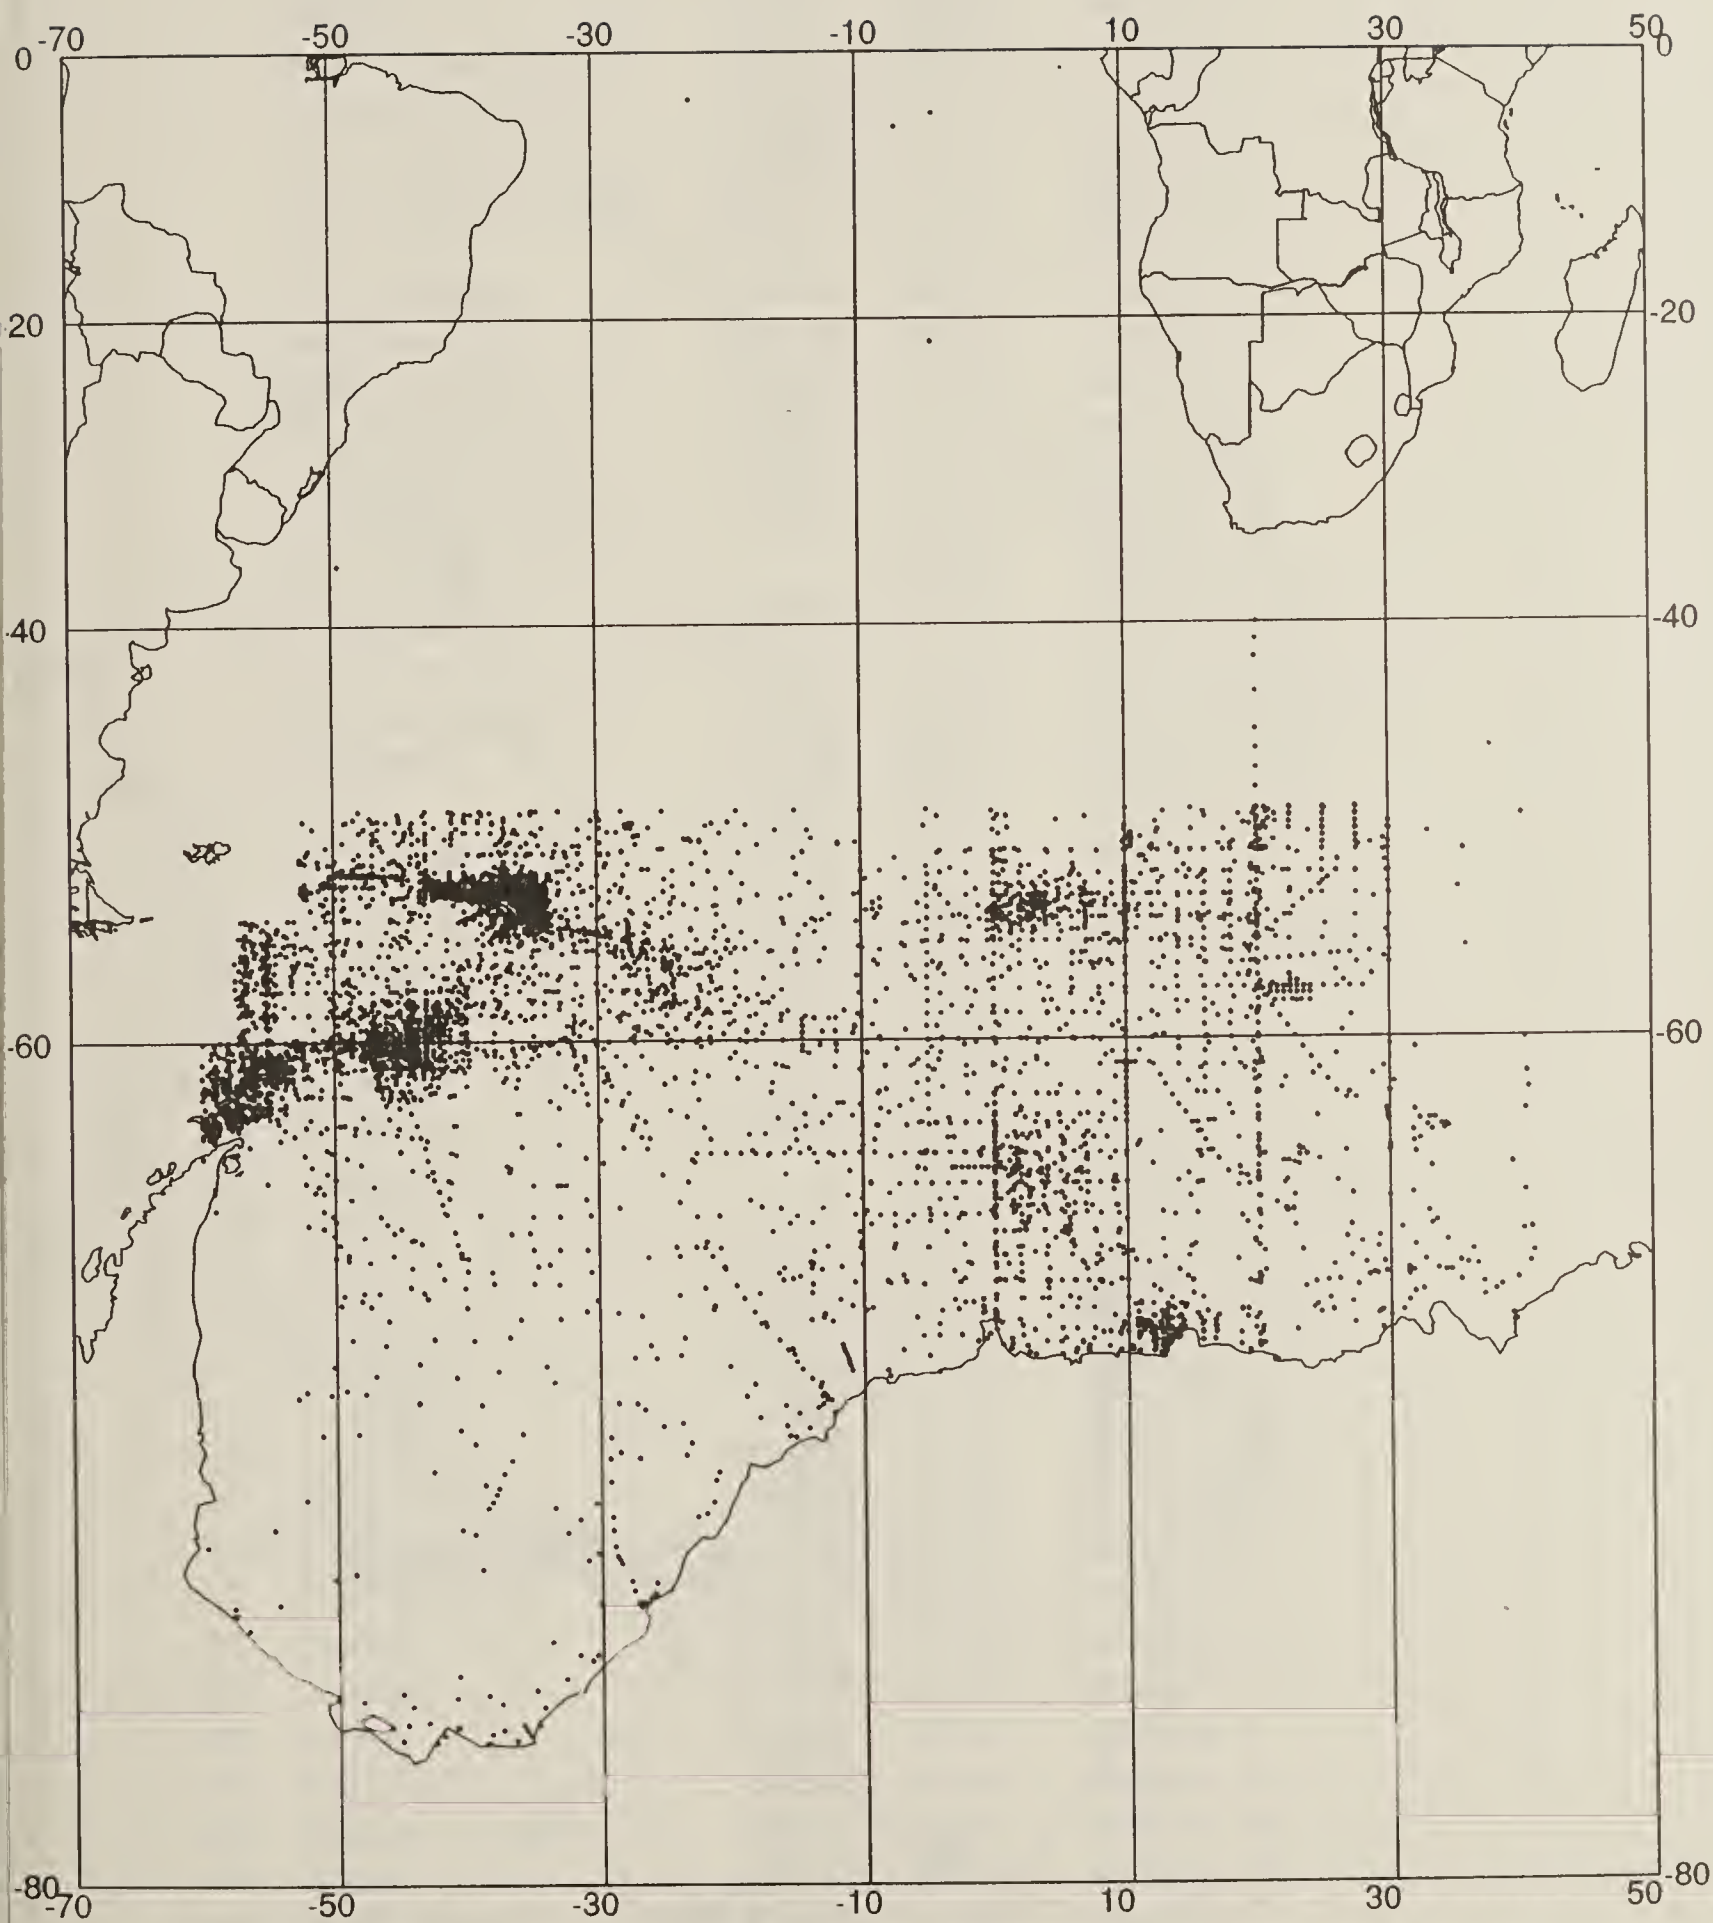

A description of the cover illustration is on the inside of the cover.

Appendix: Salinity Errors

The density of seawater in the Southern Ocean is a strong function of salinity. Consequently, a high degree of accuracy and precision is required in the measurement of salinity if estimates of density and geopotential anomaly are to be made. It was noted that the salinities in the AARI data sets typically have precisions on the order of ± 0.020 and in many cases the precision is substantially lower than this. An error in salinity of this order results in an uncertainty in dynamic height anomaly (0-5200 dbars) of order 0.07 dyn. meters, a very significant error in view of the low dynamic relief of the region (order 0.35 dyn m.).

Plots of temperature versus salinity (T-S) for the ZUBOV 1987 (fig. A1) and the VIEZE 1984 (fig. A2) data demonstrate the nature of the problem. In an effort to determine possible sources of error and to provide some guidelines for future data collection efforts, we attempted to compute a zero-order correction to the ZU87 and VI84 salinity data. The correction is based on a least-squares fit to T-S data collected on board POLARSTERN during cruise ANT V/2. We chose these data sets for analysis because they all occur in roughly the same region (Maud Rise vicinity), within which the deep T-S characteristics are reasonably well known and believed to be stable. The ANT V/2 salinity data is derived from rosette bottle samples whose conductivity ratios were measured with a Guildline 8400A salinometer standardized with IOS standard sea water batch P101. The resulting salinities have an estimated precision of ± 0.004 . Data for temperatures below 0.0°C were used to compute a linear least-squares fit to salinity of the form:

$$SA = A_0 + A_1 * TE$$

where A_0 and A_1 were found to be 34.670 and 0.0442.

The data and fitted line are shown in fig. A3. For each station containing data with temperature below 0°C , the difference between the computed fit and the observed salinity at the observed temperature was calculated (figs. A4-7). An average difference was computed for each station (excluding some outlying values) and this average difference used as a zero-order correction to the data for the entire station (figs. A8 and A9). While this approach improved the appearance of the T-S plots, its validity has not been thoroughly examined, nor are possible higher order errors accounted for (eg. the slight "curl" in deep T-S in the corrected ZU87 data, fig. A8.). Note too that this method is of no value in correcting shallow stations.

Some observations can be made from the plots of salinity difference as a function of station number (A4-7). Within-station scatter for ZU87 is roughly ± 0.01 , while station-to-station scatter is nearly twice this value. For VI84, on the other hand, within-station scatter is lower, (0.006), but station-to-station variability is higher. It is not clear from this simple analysis what the dominant sources of error might be. While differences were computed for KRILOV 1984 data, no attempt was made to apply a correction to the data as the scatter was too severe to compute useful average values.
